TITLE

METHOD FOR CUTTING FLAT GLASS

ABSTRACT :

PURPOSE: To carry out the cutting of a laminated glass easily with certainty in cutting two mutually adhered glass plates, by forming a cutting line in one of the glass plates, placing the glass plate having the cutting line under another glass plate, placing supports on both sides of the cutting line, and pushing the upper glass plate lightly from both sides.

CONSTITUTION: In cutting a laminated glass plate 1 prepared by adhering two glass plates (A) and (B), a cutting line (3A) is first formed in one (A) of the glass plates by a cutter 2. The laminated glass plate 1 is then turned over to place the glass plate (A) down. Supports 4 are placed on both sides of the cutting line (3A) or a support 4 having a recessed groove is placed with the cutting line (3A) in the recessed groove. The glass plate (B) is lightly pushed in this state to break the glass plate (A) at the cutting line (3A). A cutting line (3B) is formed by the cutter 2 at a desired position of the glass plate (B), which is turned over and placed on the supports 4. The glass plate (A) is lightly pushed to break the glass plate (B) at the cutting line (3B). Thus, the laminated glass plate 1 can be easily cut with certainty.
